EVOLUTION AND COGNITION LAB

1 PY151 research credit for participating in an experiment investigating:

Decision making under risk and uncertainty
IRB # 10-17

In the experiment, you will get the opportunity to repeatedly predict the next outcome in a sequence of two different events. In each turn, you will have to predict on which of the two sequences the resource will be present. Each correct prediction will earn you some money. Once we have finished running this experiment for all participants, six of the highest performers will be selected to receive their actual cash payout. The total time of the experiment will be about 20min.

The experiment should take about 20min. Participants will receive 1 PY151 research credit.

If you would like more information about this experiment and/or want to sign up email:
